In the gulf states, first responders have unique challenges as they work to prepare and respond during emergencies and adverse weather events like tornadoes. The infrastructure that provides radio communication with each other, and with other necessary services, is critical.

To increase the reliability of their communication systems, Madison County contracted Gulf Services to furnish and install multiple communication towers throughout the area to support their emergency operations.

The project consisted of clearing and grading the compound areas; construction of foundations for towers, shelters, and accessory equipment; installation of electrical, grounding and site fencing; setting the shelters; and of course, tower erection. All of the sites were completed on schedule and without change orders.
